

# PRESENTATION

From engineering to implementation.

## Baggage in all its forms

Whether it is about implementing a new terminal or redesigning an existing system, TG concept supports its customers from engineering to the conception of baggage handling systems in all its forms.

During the different project phases: audit, feasibility, studies, design, choice of equipment, installation and monitoring, our objective will be to find the best solution to meet the need. As an equipment integrator, we make sure to optimize the technological choices in adequacy with the possible equipment, the implantation and particularly its integration with the operational and passenger flows.

## Your needs in baggage handling

Global air traffic continues to grow. The International Civil Aviation Organization (ICAO) estimates that the number of air passengers will reach 6 billion by 2030. This increase in traffic calls into question the current logistical and infrastructure models of airports. They must adapt quickly and sustainably.

Airports are faced with 3 major factors that push them to change their baggage handling equipment:

- ✓ Increase in flows
- ✓ Change in security regulations
- ✓ Obsolescence or failure of their facilities

TG concept is there to supports them.

## Our solutions

We are a distinctive company on the market by our dual competence in engineering and in integration and realization of BHS and PIF systems.

This dual competence provides our customers with a real added value. We know the methods, the technologies but also the constraints of our customers.

[Increase the capacity of your baggage handling system](#)

- ✓ Implement new lines
- ✓ Improve existing lines

#### Bringing into conformity

- ✓ Monitoring of standards and recommendations
- ✓ Advice and recommendations
- ✓ Anticipation of future constraints

#### Upgrade your facilities

- ✓ Upgrade your equipment
- ✓ Increase the availability of your systems
